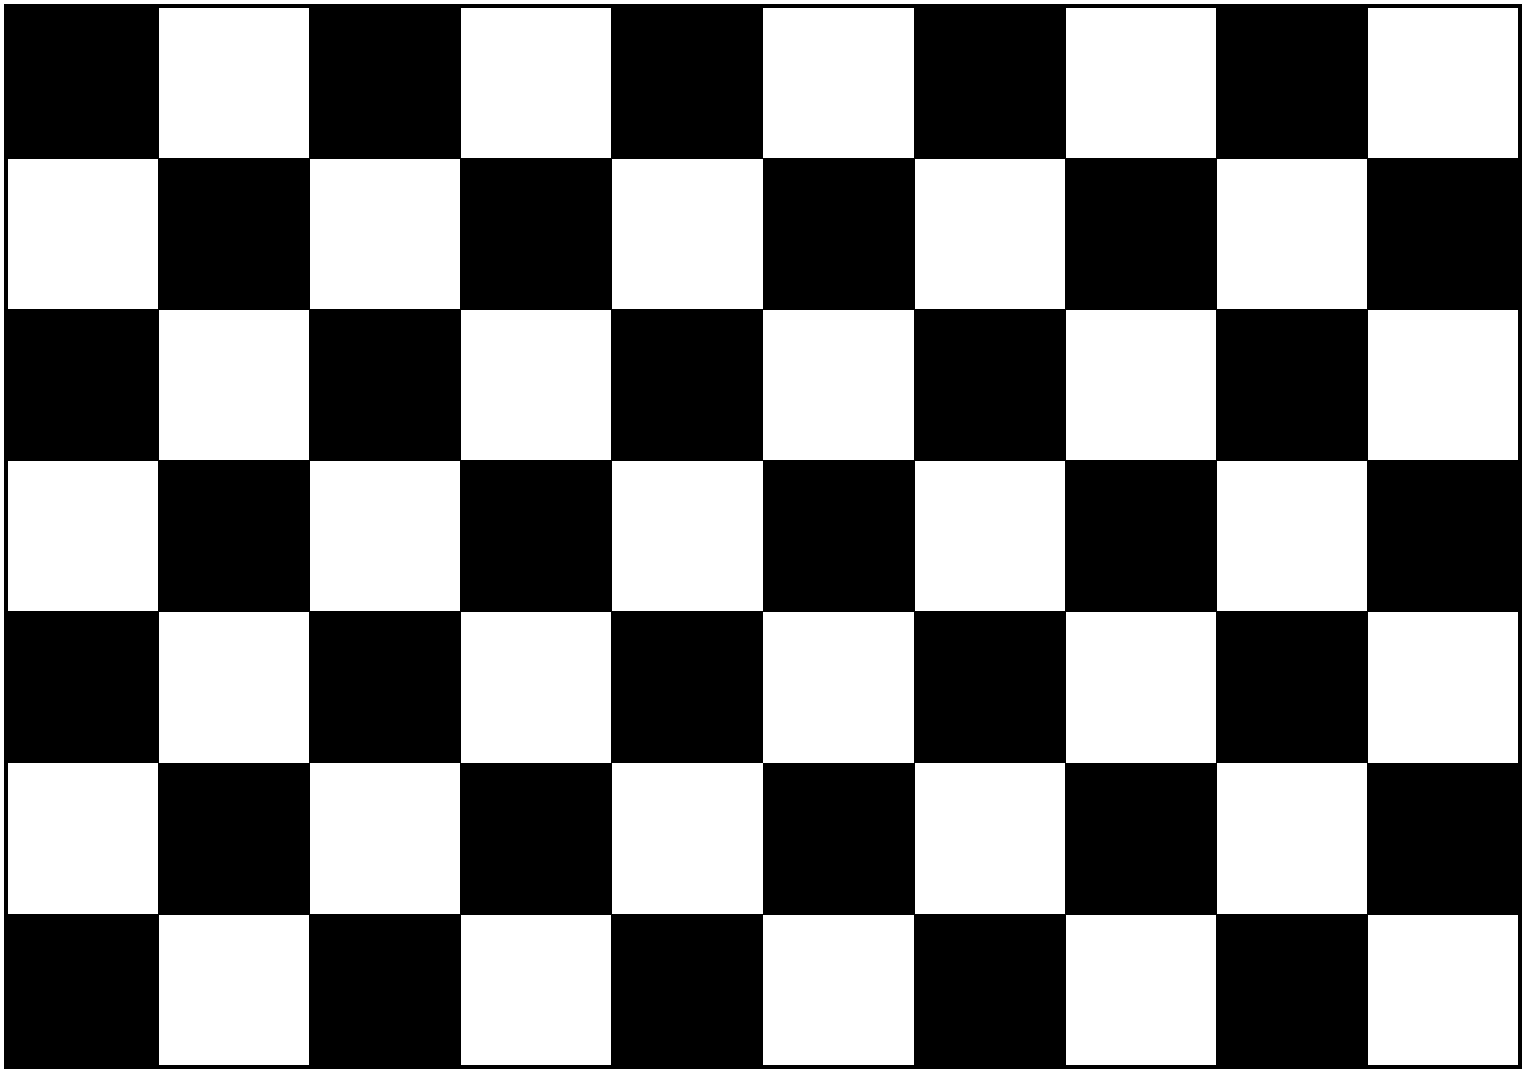
TARI calibration board 9 x 6 inner corners 20.0 mm squares



PRINT AT 100%. Turn OFF "fit to page" / "shrink to fit" / "scale to fit".

THEN MEASURE IT. 1% of scale error is 1% of the solved camera standoff,
which at 0.55 m is 5.5 mm -- most of the error this procedure exists to remove.
Caliper INSIDE jaws against the inner faces of the border bars:
long axis 200.00 mm (10 squares) short axis 140.00 mm (7 squares)

At the dgpy prompt: CAL_BOARD_SQUARE = 0.020
set_board_square(<long axis in METRES>, n=10)

Bond it FLAT before use. The caliper fixes scale; nothing fixes a bubble.
